

LOOPSHIFT

From fragmented operations to decisions that actually move the business

The reality most organizations are operating in:

You've invested in systems, built capable teams and you're generating more data than ever. Yet, some of the most important questions still take too long to answer.

- **Where is cost really being driven?**
- **Why are processes slower than expected?**
- **Which suppliers are actually performing, and which are not?**
- **Where are risks building before they surface?**

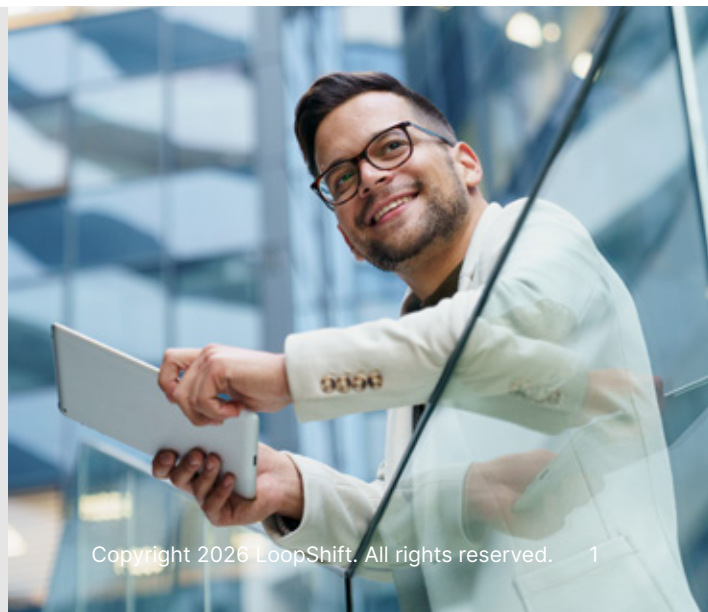

The challenge isn't a lack of tools. It's that data, decisions, and execution don't connect. So work keeps moving, but clarity never quite catches up.

LoopShift works with you to bring structure to complexity, connecting what already exists across your business, so you can operate with clarity and intent.

Not by adding another layer of tools. But by making your current ecosystem work as one!

LOOPSHIFT

Advanced Analytics & Decision Intelligence

You want a clear, reliable view of how your business is actually performing across spend, suppliers, and operations, so you can act faster and with confidence.

Where you struggle

Most organizations don't lack data. They lack connected insight. That's why:

- Spend is visible but not fully explained.
- Procurement activity is tracked but not clearly optimized.
- Supplier performance is measured, but not easily comparable.

As a result, decisions take time and often rely on interpretation rather than evidence.

What changes with LoopShift

Bring fragmented data together into a single analytical view that reflects how your business truly operates. Not just to show what's happening, but to help you understand what's driving it, and what to do next.

You're able to

- Identify the true drivers behind cost and margin pressure
- See where processes are slowing down or breaking
- Compare suppliers based on performance, not perception
- Connect procurement decisions to operational outcomes

The shift

Decisions

Move from discussion → direction.

Procurement

Moves from activity → measurable impact.

Automation & Process Optimization

You want processes that run faster, more consistently, and with fewer errors, without adding complexity.

Where you struggle

Even in digitally mature environments, critical processes still rely heavily on manual effort.

- Approvals take longer than expected.
- Exceptions and rework become routine.
- Automation exists, but only in isolated pockets.

As complexity grows, so does the operational burden.

What changes with LoopShift

We focus on optimizing processes end-to-end, not just automating individual steps. We start by understanding where processes slow down or fail, redesign them for efficiency, and then apply intelligent automation where it actually makes a difference.

You're able to

- Reduce cycle times across procurement and operations
- Minimize errors and manual intervention
- Standardize execution across teams and regions
- Build automation that scales, not breaks

The shift

Operations

Move from reactive → to reliable.

Teams

Move from execution-heavy → to value-focused.

Data Strategy & Platforms

You want your data to support better decisions, faster analytics, and future AI use cases, without rebuilding your entire technology landscape.

Where you struggle

Most data environments were not designed for today's demands.

- Data is spread across systems with inconsistent definitions.
- New initiatives require time-consuming integration efforts.
- Analytics takes longer to deploy than expected.

And as a result, progress slows, even when the intent is clear.

What changes with LoopShift

We help you establish a data foundation that is practical, scalable, and aligned to how your business actually operates. Instead of replacing systems, we connect and structure what already exists, creating a unified layer that supports analytics, automation, and AI.

You're able to

- Create a single, consistent view across fragmented systems
- Standardize definitions and business logic
- Deploy analytics and new use cases faster
- Enable AI initiatives with reliable, structured data

The shift

Data

Moves from fragmented → trusted.

Analytics

Moves from delayed → actionable.

Sustainability & ICV Enablement

What you're trying to do: You want sustainability and ICV to be part of real business decisions, not just reporting requirements.

Where you struggle

In many organizations, sustainability remains disconnected from day-to-day operations.

- Data is scattered
- Tracking is manual
- Reporting exists, but lacks depth and credibility

And most importantly, sustainability doesn't consistently influence sourcing or investment decisions.

What changes with LoopShift

Embed sustainability and ICV into operational and procurement workflows, so they become part of how decisions are made.

You're able to

- Integrate ESG and ICV metrics into sourcing and supplier evaluation
- Link sustainability performance to financial and operational outcomes
- Automate tracking across suppliers, projects, and spend
- Build transparent, auditable reporting frameworks

The shift

Sustainability

Moves from compliance → capability.

ICV

Moves from reporting → strategic value.

A connected approach that drives real outcomes because real improvement doesn't come from fixing one part of the system. It comes from connecting everything:

- **Data informs better decisions**
- **Decisions drive better execution**
- **Execution creates measurable outcomes**
- **Outcomes feed back into continuous improvement**

That's the loop. And when it works, the business moves differently.

If nothing changes

- Costs remain hidden in plain sight.
- Processes slow down as complexity increases.
- Automation stays limited.
- Decisions remain reactive.

If it does

- You move faster.
- Operate with clarity.
- Make decisions that stand up to scrutiny.

Transform, optimize, repeat! Turn time into money.
